Linear Analysis of a 2D Frame

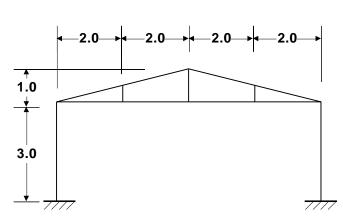

For LUSAS version:	18.0
For software product(s):	LUSAS Civil & Structural LT and above, or
	LUSAS Bridge LT and above
With product option(s):	None.

Description

A simple 2D frame is to be modelled and analysed. The geometry of the frame is as shown.

All members are made of mild steel.

The structure is subjected to two loadcases; the selfweight of the structure,

and a sway load at the top of the left-hand column.

The units of the analysis are N, m, kg, s, C throughout.

Objectives

The required output from the analysis consists of:

- □ A deformed shape plot showing displacements caused by the imposed loading.
- □ An axial force diagram showing stresses in the members.

Keywords

2D, Frame, Beam, Standard Sections, Fleshing, Copy, Mirror, Deformed Mesh, Axial Force Diagram, Shear Force Diagram, Bending Moment Diagram, Fibre Results, Saved view, Generating a Report, Printing Results.

Associated Files

□ frame_2d_modelling.vbs carries out the modelling of the example.

Modelling

Running LUSAS Modeller

For details of how to run LUSAS Modeller, see the heading *Running LUSAS Modeller* in the *Introduction to LUSAS Worked Examples* document.

Note. This example is written assuming a new LUSAS Modeller session has been started. If continuing from an existing Modeller session select the menu command **File>New** to start a new model file. Modeller will prompt for any unsaved data and display the New Model dialog.

Creating a New Model

- Enter a file name of **Frame_2D**
- Use the **Default** userdefined working folder.
- Ensure an Analysis type of **Structural** is set.
- Select an Analysis Category of **2D Inplane**
- Set Model units of N,m,kg,s,C

File name	Frame_2D				
Working folder					
C Recent	B:\changerequests\cr22000-22999\cr22452				
Output User-defined	C:\Users\paul_b\Documents\LUSAS 16.0\Projects Set				
Model properties -					
Analysis type	Structural Model units N,m,kg,s,C				
Analysis category	2D Inplane Timescale units Seconds				
Optional					
Startup template	2D Frame Layout grid None				
Title	Simple 2D Frame				
Job number					

- Ensure Timescale units are in **Seconds**
- Select a Startup template of **2D Frame**.
- Ensure the Layout grid is set as **None**

- Enter a Title of Simple 2D Frame
- Click the **OK** button.

The Attributes 💑 treeview will be populated with potentially useful basic line mesh, geometric and support entries appropriate to the settings made on the new model dialog.

Note. The Undo button may be used to correct a mistake. The undo button allows any number of actions since the last save to be undone.

Feature Geometry

Geometry	
Point	>
By Coords	

Enter coordinates of (0, 0), and after pressing the **Tab** key to move to the next entry field on the dialog, enter additional points of. (0, 3), (4, 3) and (4, 4) to define the main setting-out points for one-half of the portal frame. With all the coordinates entered click the **OK** button.

Note. Sets of coordinates must be separated by commas or spaces unless the 'Grid Style' method is chosen.

Select the two Points on the left-hand side of the model.

Ge	eometry	
	Line	>
	Points	

Geometry	
Line	>
Points	

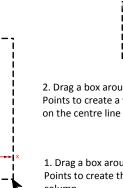

Connect the selected Points with a Line representing the left-hand column of the portal frame.

• Select the pairs of Points on the right hand side of the model.

Connect the selected Points with a Line

representing the right-hand vertical member

on the frame centreline.

2. Drag a box around these two Points to create a vertical line on the centre line of the Frame

1. Drag a box around these two Points to create the left hand column

- Create the horizontal member by selecting the appropriate Points and define a Line in a similar manner.
- Select the Points at the top of the left hand column and the apex of the roof. ٠ (Hold down the **Shift** key to add the second Point to the initial selection).

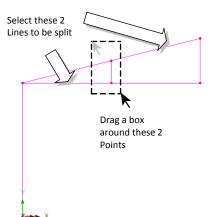

```
Geometry
  Line
    Points.
```

Connect the selected Points with a Line representing the sloping member of the frame.

To create the vertical roof member at quarter span the 2 Lines shown are split into equal divisions to create the points required and the new line is then defined.

- Select the lower line (first) and the upper line (second) of those shown (Hold down the **Shift** key to add the second Line to the initial selection).
- Enter the number of divisions for both Lines as **2**
- Ensure that **Delete original lines after splitting** is set so that the original Lines are deleted and click the **OK** button.
- Drag a box around the 2 Points just created.

G	eometry	
	Line	>
	By Points	

Geometry

By Splitting

In Equal

Divisions...

Create the Line representing the internal member.

This completes the geometry definition for the half-frame.

Model attributes (mesh, material, geometric properties etc.) now need to be defined and assigned to the model.

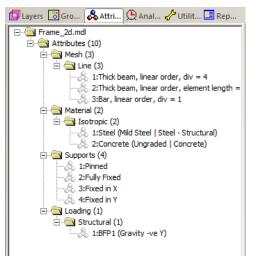

>

>

Note. LUSAS Modeller works on a define and assign basis where attributes are first defined, then assigned to features of the model. This can be done either in a step-by-step fashion for each attribute or by defining all attributes first and then assigning all in turn to the model.

Attributes, once defined, are displayed in the Treeview. Unassigned attributes appear 'greyed-out'.

Attributes are then assigned to features by dragging an attribute dataset from the Treeview onto features previously selected in

onto features previously selected in the model view window.

The Treeview panel shows a variety of attributes that were defined as a result of selecting the 2D Frame template.

4

Tip. Useful commands relating to the manipulation of attributes can be accessed by selecting an attribute in the structure, then clicking the right-hand mouse button to display a shortcut menu.

Meshing

The Line features are to be meshed using two-dimensional beam elements. A 2D thick beam element is automatically provided in the Attributes review but to show the process involved another will be defined:

Attributes Mesh > Line...

- Select Thick beam, Linear elements.
- Set the number of divisions to be 1
- Enter the attribute name as Thick Beam then click OK
- Select the whole model. (Ctrl and A keys together).
- Drag and drop the mesh attribute **Thick Beam** from the selected model Lines.

Note. When an assignment is made confirmation of the assignment is written to the Text Output Window.

Material Properties

Steel of the required grade is already present in the Attributes 💑 Treeview.

• With the whole model selected (**Ctrl** and **A** keys together) drag and drop the material attribute **Steel** (**Mild Steel** | **Steel Structural**) from the selected features.

Geometric Properties

Attributes Geometric Section Library... The standard sections dialog will appear.

• Select the library of UK Sections

- Select section type Universal Beams (BS4)
- Select section name 127x76x13kg UB.
- Enter the Attribute name as **stanchion**.
- Click the **Apply** button to add the Universal Beam attribute to the Treeview.
- Change the library to **EU** Sections.
- Change the section type to **Equal** Angles, and select the **70x70x6 EA** section name.
- Enter the Attribute name as **roof member**
- Click the **OK** button to add the Equal Angle attribute to the Treeview.

Note. The Treeview name given to the attribute consists of the stated name followed by the library section name, and the orientation of the section in parentheses. Only the stated name can be renamed.

Assigning Geometric Properties

- Select the Line representing the lefthand vertical member.
- Drag and drop the geometry attribute Stanchion (127x76x13kg UB) from the 💑 Treeview onto the selected Line.
- Drag a box around the Lines representing the roof members.
- Drag and drop the geometry attribute Roof member (70x70x6 EA from the here the selected Lines.

Geometric assignments are visualised by default.

• Click in a blank part of the View Window to deselect the members.

Select the isometric button to see the geometric visualisation on the members.

٩đ The Zoom in button can be used to check the orientations.

Select the Home button to return the model to the default view.

Select the fleshing on/off button to turn-off the geometric visualisation.

Supports

LUSAS provides the more common types of support by default. These can be seen in the $\overset{\bullet}{\leftrightarrow}$ Treeview. The structure will be supported at the end of the stanchion which is in contact with the ground with a fully fixed support condition.

Assigning the Supports

• Select the Point at the bottom of the left-hand vertical member.

- Drag and drop the support attribute **Fully Fixed** from the selected feature.
- Ensure the **Assign to points** and **All analysis loadcases** options are selected and click **OK**

Mirroring the Model

One half of the 2D frame has now been generated. This half can now be copied about a mirror plane to create the complete frame.

• Select the whole model (Ctrl and A keys together).

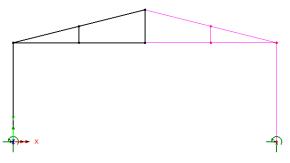

Select Mirror, select Parallel to Y axis and enter 4 in X, and 0 in Z in the top
cells and 4 in X, and 3 in Z in the lower cells to define the points defining the mirror
plane.

• Click the **OK** button to create the full model.

Geometry Line Copy...

Note. Features that are copied retain their attributes. This means that there is no need to define the mesh, material or geometric properties for the newly created Lines as they will already have the attributes

from the original half of the model assigned.

Note. In mirroring the features the Line directions will have been reversed. The orientation of Lines is important as it controls the local beam axes directions which will define the sign convention used to present the results.

• In the Layers Treeview double-click on **Geometry** to display the geometry layer properties. Select the **Line directions** option and click **OK**

The orientations of the lines are shown.

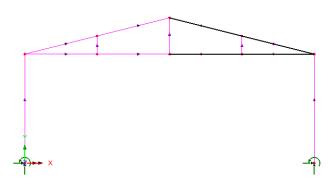

• Select the 4 Lines on the right-hand side of the roof that are to be reversed. (Hold down the **Shift** key to add lines to the initial selection).

selected

will

Line

be

• Once the Line directions are corrected, de-select the Line directions option in the geometry layer properties and click the **OK** button.

Loading

The

directions

reversed.

Two loadcases will be considered; self weight, and a concentrated sway load acting at the top of the left-hand vertical member.

Loadcase 1 - Self Weight

Loadcase 1 will represent the self-weight of the structure. This is modelled using a constant body force, which is an acceleration loading simulating the force of gravity acting upon the structure.

Gravity loading is already present in the Attributes 🖧 Treeview.

- Select the whole model (Ctrl and A keys together) and drag and drop the loading attribute BFP1 (Gravity -ve Y) from the selected features.
- Ensure that the **Assign to lines** and **Single loadcase** options are selected and the loading is applied to **Analysis 1** and **Loadcase 1**. Click the **OK** button and the loading on the frame will be displayed.

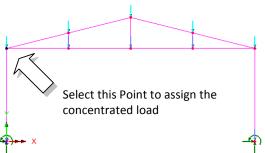

Loadcase 2 - Sway Load

Loadcase 2 is a sway load acting at the top of the left-hand vertical member.

- Ensure the Concentrated option is selected and click Next
 - Enter a concentrated load in the X direction of 500
- Enter the attribute name as Sway Load and click Finish

Attributes

- Select the Point at the top of the left-hand column.
- Drag and drop the loading attribute **Sway Load** from the **A** Treeview onto the selected Point.

- Ensure the Assign to points and Single loadcase options are selected, and that the selected analysis is Analysis 1. Change the loadcase name to Loadcase 2 by overtyping.
- Click the **OK** button to assign the loading as the active loadcase with a factor of **1**

Saving the Model.

File Save

Save the model file.

Running the Analysis

With the model loaded:

Den the Solve Now dialog. Ensure **Analysis 1** is selected and click the **OK** button to perform the analysis.

A LUSAS Datafile will be created from the model information. The LUSAS Solver uses this datafile to perform the analysis.

If the analysis is successful...

Analysis loadcase results are added to the 🕒 Treeview.

In addition, 2 files will be created in the Associated Model Data directory where the model file resides:

- □ **frame_2d.out** this output file contains details of model data, assigned attributes and selected statistics of the analysis.
- □ **frame_2d.mys** this is the LUSAS results file which is loaded automatically into the ⊖ Treeview to allow results processing to take place.

If the analysis fails...

If the analysis fails, information relating to the nature of the error encountered can be written to an output file in addition to the text output window. Any errors listed in the text output window should be corrected in LUSAS Modeller before saving the model and re-running the analysis.

Rebuilding a Model

If it proves impossible for you to correct the errors reported a file is provided to enable you to re-create the model from scratch and run an analysis successfully.

frame_2d_modelling.vbs carries out the modelling of the example.

File New...

Run Script.

File Script Start a new model file. If an existing model is open Modeller will prompt for unsaved data to be saved before opening the new file.

• Enter the file name as frame_2D

To recreate the model, select the file **frame_2d_modelling.vbs** located in the **\<LUSAS Installation Folder>\Examples\Modeller** directory.

Rerun the analysis to generate the results.

Viewing the Results

Selecting the Results to be Viewed

Analysis loadcase results are present in the \bigcirc Treeview, and the last solved loadcase (Loadcase 2) is set to be active by default. This is signified by the active results bitmap \bigcirc .

Setting a loadcase active

• In the Creeview right-click on **Loadcase 1** and select the **Set Active** option.

Deformed Mesh Plot

A deformed mesh plot is normally displayed initially to highlight any obvious errors with an analysis before progressing to more detailed results processing. The deformed shape will usually show up errors in loading or supports and may also indicate incorrect material property assignments (e.g. where the results show excessive displacements). The deformed mesh layer is already present in the Treeview.

For clarity, layers will be turned off from the display to leave only the undeformed mesh displayed.

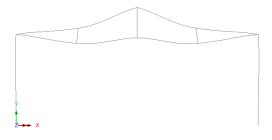

• In the Treeview turn off the display of the Geometry and Attributes layers by right-clicking on each layer name and selecting the On/Off menu item.

Note. By default the maximum displacement is scaled to the magnitude defined on the deformed mesh dialog so the deformed shape can be easily visualised. The exaggeration factor used to multiply the displacements is displayed on the deformed mesh properties dialog and can be defined if required.

The deformed mesh plot for loadcase 1 (the default active loadcase) is currently displayed on the mesh layer.

• Turn off the **Mesh** layer from the Treeview to leave only the deformed mesh displayed as shown.

Defining a Combination

The combination dialog will appear.

Combinations can be created to view the combined effects of multiple loadcases on the structure.

Available - Analysis 1		Incluc	1	Name	Fac
···· 1:Loadcase 1 ···· 2:Loadcase 2		1 2	Loadcase 1 Loadcase 2		1
	[>>			
		<<			
	Ste				
					(new)

Analyses Basic Combination Both available results loadcases should be added to the Included combination panel.

- Select Loadcase 1, hold the shift key down and select Loadcase 2. Click the
 button to add the loadcases to the load combination.
- Click the **OK** button to finish.

Note. The load factor may be modified by selecting the included loadcase in the right hand list and updating the factor.

Note. To obtain the correct effect from the combined loads, the Combination should only include one occurrence of each loadcase.

Viewing a Combination

• In the 🕒 Treeview, in the Post Processing folder, right-click on Combination 1 and select the Set Active option.

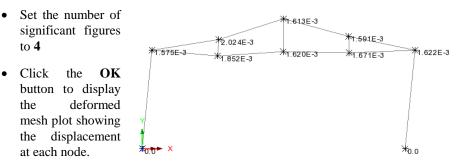

The deformed mesh plot will show the effect of the combined loading on the structure.

Marking Peak Values

• With no features selected click the right-hand mouse button in a blank part of the View window and select the **Values** option to add the values layer to the Treeview.

The values layer properties will be displayed.

- Select **Displacement** results from the Entity drop down list and select the resultant displacement **RSLT** from the Component drop down list.
- From the Values Display tab set 100% of Maxima values to be displayed.

Note. Because this example is written for LUSAS LT versions that only allow one model or results viewing window to be used the Values layer is best turned off prior to

adding further layers. In Standard and Plus versions of LUSAS multiple windows each having different layers can be defined.

• Turn off the **Values** layer in the 🛄 Treeview.

Axial Force Diagram

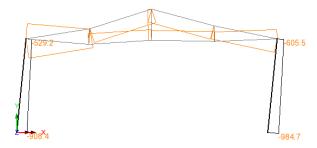

• With no features selected click the right-hand mouse button in a blank part of the graphics window and select **Diagrams** to add the diagrams layer to the Treeview.

The diagram properties will be displayed.

- Select Force/Moment results of axial force Fx in the members
- Select the **Diagram Display** tab and select the **Label values** button.
- Select the Label only if selected option.
- Ensure the number of significant figures is set to 4
- Click the **OK** button to finish.

The order of the layers in the D Treeview governs the order that the layers are displayed.

- To see the deformed mesh on top of the diagram, in the D Treeview drag and drop the deformed mesh on top of the diagrams layer.
- To add labels to the vertical members (the stanchions), select the left hand column, hold the **Shift** key and then select the right hand column.

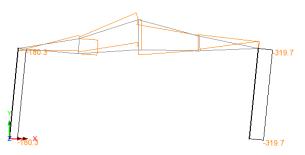

An axial force diagram for each member will be

displayed with values of Fx displayed on the selected columns.

Shear Force Diagram

- In the Treeview double-click on the **Diagrams** layer. The diagram properties will be displayed.
- Select Force/Moment results of shear force Fy in the members.

• Click the **OK** button to display a shear force diagram of stresses in each member with labels on the selected vertical members.

Bending Moment Diagram

- In the Treeview double-click on the **Diagrams** layer. The diagram properties will be displayed.
- Select Force/Moment results of bending moments in the members Mz
- Click the **OK** button to display a bending moment diagram for each member with labels on the selected vertical members.

Viewing Results on Fleshed Members

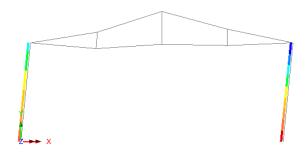

As an alternative to plotting diagram results stresses in beams can be plotted on fleshed members.

- Turn off the **Diagrams** layer in the 🛄 Treeview.
- Click in a blank part of the Graphics Window to deselect the members.
- With no features selected click the right-hand mouse button in a blank part of the view window and select **Contours** to add the contours layer to the Treeview.

The contour properties dialog will be displayed.

• Select Stress results of axial and moment results in the members Sx(Fx, Mz)

Because a different result component was requested previously for the Values (and Diagrams) layer a message appears asking if specified component that should also be updated to the new choice.

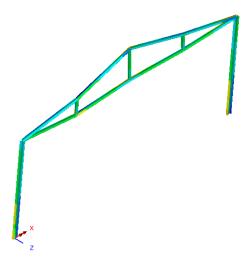

• Click the Yes button to accept.

Initially the contours of stress will be drawn only at the current active fibre location on both stanchions as seen on the image above. A contour key will also be drawn. Fibre locations will be explained shortly.

Select the fleshing on/off button to visualise the stress results on the fleshed crosssection as seen on isometric image shown below.

Select the fleshing on/off button again to turn off the visualisation.

Fibre Locations

As an alternative to plotting force and moment diagrams along nodal lines, diagrams of stresses can be plotted at fibre locations on members.

Standard steel sections have various extreme fibre locations pre-defined. These fibre locations can be seen by expanding the Geometric Line entry in the in the streeview and can be visualised by double-clicking the Geometric Line attribute name and selecting the **Section details** button.

Plotting of results for a particular fibre location is done by selecting the **Set Fibre Active** context menu item as shown in the image opposite.

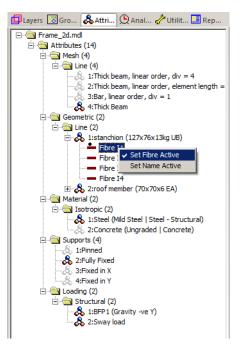

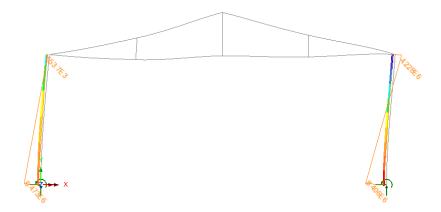

Diagram Stress Results at Fibre Locations

- Press the Z: N/A button at the bottom of the interface to view the model along the z-axis.
- In the Diagrams layer.
- In the I Treeview drag and drop the **Diagrams** layer on top of the Contours layer to ensure that the diagrams are plotted on top of the contours in the view window.
- Double-click on the **Diagrams** layer and select **Stress** results of stress **Sx(Fx, Mz)** in the beam.
- Select the **Diagram Display** tab and ensure the **Label values** option is selected, and the **Label only if selected** option is <u>deselected</u>. Change the angle of the text to **-45** and ensure that the number of significant figures to **4**.
- Select the Scale tab and set a local scale of magnitude 12mm.
- Click **OK** to display the stress diagram at Fibre location I1.

Saving views of the model

Saved views of the model can be applied to other views to easily update the layers and settings used in that view. Saved views can also be inserted into reports (such that each time a model report is generated, the saved view will be updated to show the current state of the model and results at the time of creating the report). The insertion of a saved view into a report will be shown in this example.

- Window Save View...
- Leave the view name as **View1** and click **OK** to save the view entry into the Utilities $\sqrt[4]{2}$ Treeview.

Save the Model

File Save

Save the model file.

Note. When the model file is saved all load combinations, envelopes, saved views and graph datasets, if defined, are also saved and therefore do not have to be re-created when the model and associated results file is re-opened at a later date.

Creating a Model Report

Specified model and results details can be exported to a variety of output formats by using the LUSAS report facility. Reports can include model and results data, saved views, graphs, one-click reports, screen captures, user-content and additional text. A report template, used to specify items to be included in a report, is saved in the Report Treeview when a model is saved. Multiple report templates are permitted. When creating a new model making use of a model template a basic report entry is automatically set-up in the Report Treeview. This example will add an additional report entry to that treeview.

Utilities Reporting New report... On the Report dialog enter a report title of 2D Frame

- Leave the modelling units and the number of significant figures set to default values.
- Enter a report name of **Report 1** and click **OK**.

A report entry will be created in the Report 🛄 Treeview.

- In the Report 🖹 Treeview right-click on **Report 1** and select **Add Chapter**
- On the Chapters dialog, with the **Model properties** tab selected select the **All** checkbox. By default this will add all model property data for All loadcases for the Full model.

1odel properties Results User con	· · ·	
Geometry Geometry Opinits	Attributes	Loadcases
Significant figures Decimal places	Loadcases All	
Show trailing zeros Threshold value N/A	Extent Full model	

• On the Chapters dialog select the **Results** tab and click the **New** button.

	 Components 	C Eigenvalues
Results		Reported components
Loadcases	All	⊡ I All
Entity	Force/Moment - Thick 2D Beam	I Fx
Location	Averaged nodal	₩ Fy ₩ Mz
Extent	Full model	⊞-⊡Energy
Output	Tabular and Summary	
Order	Loadcase/Feature

	now	Precision Significant figures Decimal places Show trailing zeros Threshold value V/A
	Name PRW1	× (1)

- On the now displayed Print Results Wizard dialog make the following selections:
- Loadcase: All
- Entity: Force/Moment Thick 2D Beam
- Location: Averaged nodal
- Extent: Full model
- Output: Tabular and Summary
- Order: Loadcase/Feature
- Click **OK** to finish.
- Back on the Report Chapters dialog select the **Saved views** tab and check (tick) the **Saved view** check-box to include the contents of **View 1** in the Report. By default this will add the view contents for the Specified loadcase for the Elements showing results.
- Click **OK** to finish.

The Report Treeview will fill with chapters relating to the content selected.

Note. The default order of the items in the Report Treeview (and hence the order of any items on any exported report) can be changed by dragging and dropping the report sections as required. Right-clicking on an item gives access to additional options, such as modifying existing data or adding more chapters.

Viewing / Exporting a Report

Viewing a report automatically generates a PDF file using the report export facility.

• In the Report 🖺 Treeview right-click on **Report 1** and select **View Report**

After a short pause whilst the requested report information is generated, a PDF file will be created and the first page of the report will be displayed.

Other export formats including Microsoft Excel (97-2003) are also available.

This completes the example.
